

Version 16.1.0 – November 2024

Last Modified on 11/13/2024 10:28 pm EST

The latest EventsAir release (16.1.0) includes a number of improvements and resolutions to issues, as documented below, and will be rolled out from Tuesday 19th November.

For further information, please reach out to our support team [here](#).

Public API changes – see notes below.

IMPROVED

Show All

Custom Domains authorization

- Clearer wording on Custom Domains authorization pop-up.

UI uplift – additional improvements

- New styling on “Recent/Pinned Attendee” hover card.
- Updated “Re-assign” in Project Manager & Run Sheet to “Reassign” for consistency.
- Screens/fields extended to allow for longer item names (e.g. in the Attendees Panel – Agenda items; Travel sectors; Accommodation tabs)
- Wider screens to show all columns/items (Bulk Creation; Bulk Delete; CE Course Attendance) and in Setup Panel (Registrations, Functions, Accommodation, Travel, Presentations, Accounting & Custom Fields).

RESOLVED

Custom Domains

Validation

- Domain validation wasn’t being applied correctly when setting up a custom domain for an event website. [REF: PQ-331]

Online panel – Attendee App

Agenda

- The option to show Agenda items based on location was also applying to Headings & Information blocks (which have no location, so weren’t showing). [REF: PQ-469]

Attendee search

- Attendee Search for more than 200 attendees wasn't immediately loading in the correct order. [REF: AE-71]

Gamification goals

- EventStream Engage Goals set to be only available via the OnAir Portal were also visible in the Attendee App. [REF: PQ-63]

Merge doc Auto Login token

- An auto login token added to a Merge Doc via HTML element wasn't launching the Attendee App correctly on Android devices. [REFS: PE-424, PQ-492]

News

- Attendee App news component didn't update correctly unless manually saved or Auto Refresh rolled over. [REF: AE-17]

Text used for refresh interval error warning

- Error message if Auto App Refresh dates were put in incorrectly said "less than" when it should have said "greater than". [REF: AE-98]

Static Content component HTML text

- Large blocks of text weren't wrapping correctly (would go off the screen) in Static Content HTML components. [REF: AE-72]

Online panel – Interactive sites

Group registrations

- Adding a Group Component to a registration site was causing sign-in to fail. [REF: PE-478]

Changing/editing items (when registering)

- Selecting the "No Accommodation Required" checkbox on a registration site would cancel bookings made later, even after the box was unchecked. [REF: PQ-34]
- Intermittent issue — editing (canceling) Registration or Function items after getting to the Summary Page would sometimes fail to cancel them on submission. [REFS: PQ-544, PE-512]

Logic

- If an attendee re-visited a site they'd been to earlier, any Part Logic wasn't respected; any page with both Component and Page Logic applied to the same page would display all options. [REFS: PQ-520, PQ-137, PQ-548]
- Component Logic wasn't working if it was based on a Function Fee Type with an input type of Number. [REF: PQ-542]

Reporting

Intermittent error – Tax Summary List

- Total Report Values in the Tax Summary List report would sometimes not calculate correctly. [REF: PQ-263]

EVENTSAIR PUBLIC API CHANGES

If you're a developer using the EventsAir public API, please check the Developer Portal for upcoming changes. This doesn't apply to customers with Smart Connector integrations, as these changes are already incorporated within your Smart Connector.
